

Applications which impersonate Applications

When we install an application from Google Play Store, we should be aware that it is not the only application that we can install. Besides, application can be installed manually.

If someone might manually install an application, this application could likely connect to another device and impersonate the application (from Google Play Store). This can be considered a vulnerability.

One solution could be to create new rules so that an Engineer cannot do that, even if he/she wanted to.

If anyone tries to impersonate an application, I suggest Manufacturers or new Engineers who are going to come, to create new Security Layers.

It is not completely responsible of Android Engineering Team. In contrast, it is responsibility of Companies or Engineers who commercialized its own applications.

An idea could be to warn these Manufacturers that they should create its own security so that no other software can impersonate its applications.
