

How can you predict next value from a serie of values without using Statistics or AI?

It is possible to find the next action value if we analyze the times where the action values goes up.

If the same or similar situation happens repeatedly, then we can say how it is going to be the next situation and predict more assertively the next value.

This allows investing in the right moment. When the action value is going to be higher than the action value we bought some time ago.
