

# How to connect securely

When someone connects remotely either to a hardware or smart device. It is not secure because nowadays, smart devices can connect with other devices remotely.

Someone can connect to a device using our smart device. This connection between different hardware or smart devices, is dangerous because if this connection is transmitting data to another device which is not ours. I mean, it is a smart device that we do not know where it comes from. Then, this connection kind could lead to real issues.

At the moment, someone connects to another device which has our same Signature. For example, we may use an Account as Signature, like Samsung or Google. We can use an Account to start using our smart device. Then, we might review, if we are connecting to a device, with same Signature (Account).

Now, we connect to, with something that we know which are connecting to.

Besides, it should be told as well. Someone may connect remotely using a Service. For example, it could be NFC, Wi-Fi, or another one Service that smart devices provide nowadays.
