

Application installed under Android OS

When you install an application and there might exist eventually a vulnerability.

An application is developed by a third-party company. So, you do not know what purposes may be underneath.

Application may be taking by granted some sensitive information from you.

A recommend solution could be asking Application Development Team which type of information will need, and according to that, Android Engineering Team could let this application to be installed or not.

If there is not a solid rule to respect between the application (recently installed) and user. Then, there could be a future problem later.

Probably this mentioned application is getting and selling data with user-information collected to make other actions which has nothing to do with the commercial side.

Android OS should create new policy in order to put some restrictions.
